

# Runbook: ACM Certificate DNS Validation (GoDaddy Domains)

Last updated: 2026-01-23

## Purpose

Resolve pending DNS validation for ACM certificates when domains are registered in GoDaddy.

## Symptoms

- ACM shows 'Pending validation' for www subdomain
- Non-www validated but www still pending
- Validation CNAME records appear correct but not picked up

## Checklist

- In ACM, expand each domain and copy the CNAME Name/Value exactly.
- In GoDaddy DNS, add CNAME record with Host = the leftmost label (not the full domain) when GoDaddy auto-appends domain.
- Ensure there is no conflicting record (A/AAAA/CNAME) for the same name.
- Wait for DNS propagation; re-check with 'dig' or online DNS checker.

## Common Gotchas

- GoDaddy UI may auto-add the domain; avoid duplicating the domain in the Host field.
- If you already have a CNAME for www, ACM validation CNAME must be unique; remove/rename conflicts.
- TTL: use default or 600s to speed revalidation.

## Verification

```
dig +short CNAME _www.example.com
dig +short CNAME _example.com
```
